a

TNFRSF12A in oncofetal cells, tumour by tumour

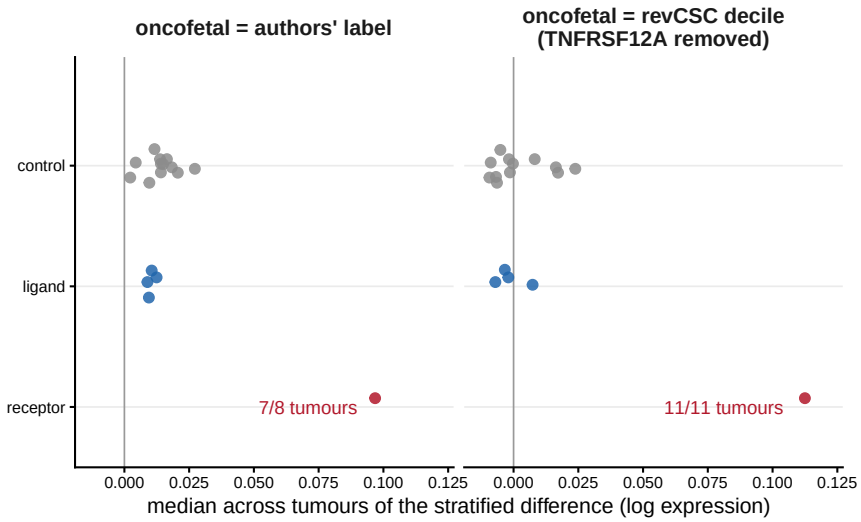

red TNFRSF12A | blue ligands | grey 12 detection−matched control genes

b

The receptor separates from ligands and from control genes

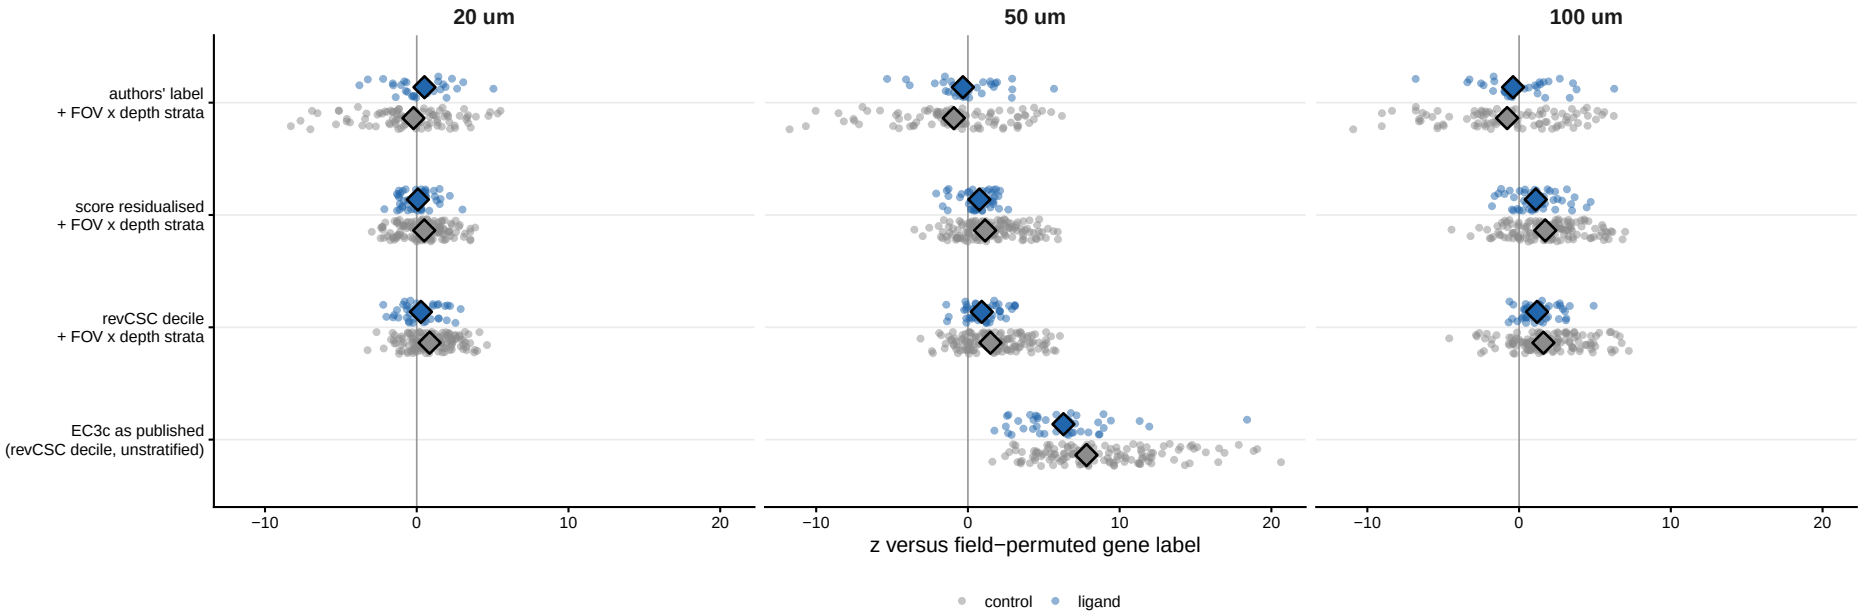

one point per gene

c

Where the spurious colocalisation comes from

diamonds, medians; the published EC3c test exists at 50 um only; stratifying on field and detection quintile removes most of the inflation, but not all

d

Conditioning on the receptor does not recover a niche

one point per tumour x gene; black diamond, median
