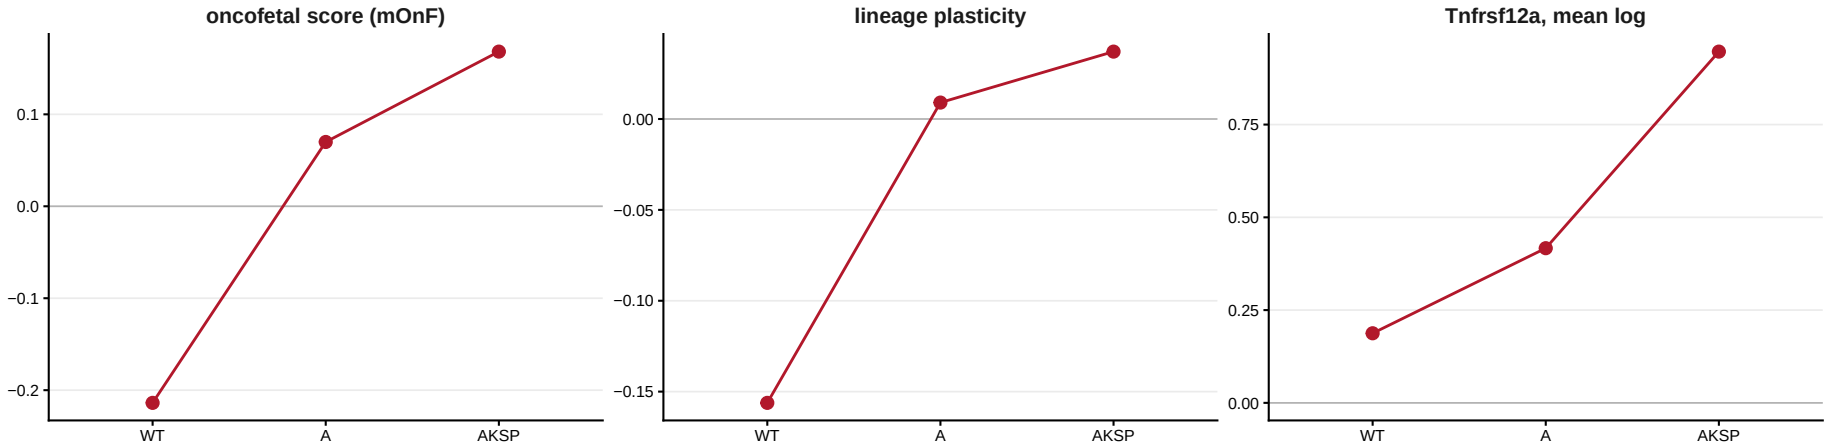
a

The receptor tracks the oncofetal state across the three models

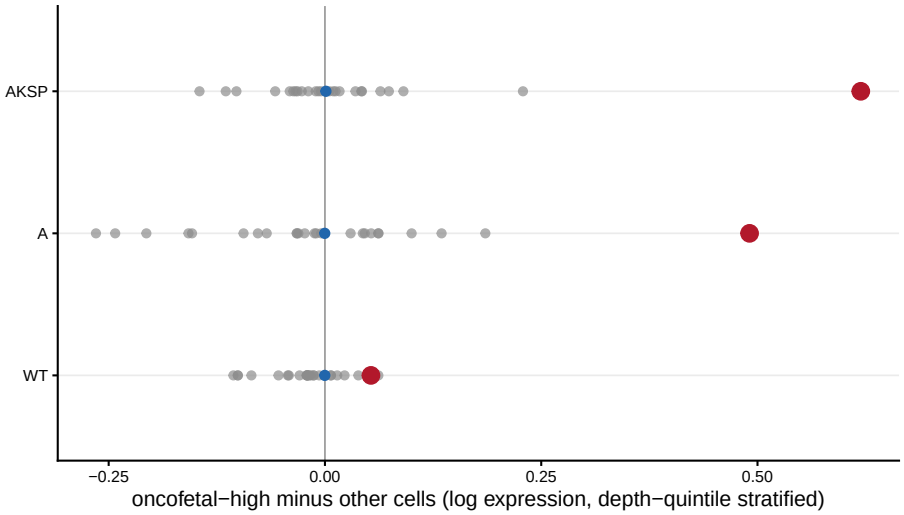
cell means per library; WT organoids, A (Apc−null) and AKSP tumoroids



b

Tnfrsf12a separates oncofetal cells, and only where they exist

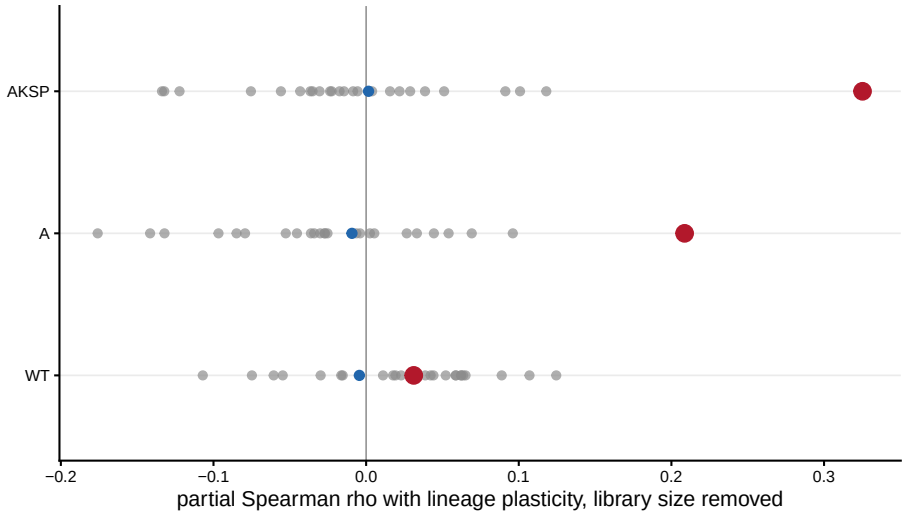
red Tnfrsf12a | blue Tnfsf12 | grey 24 detection−matched control genes



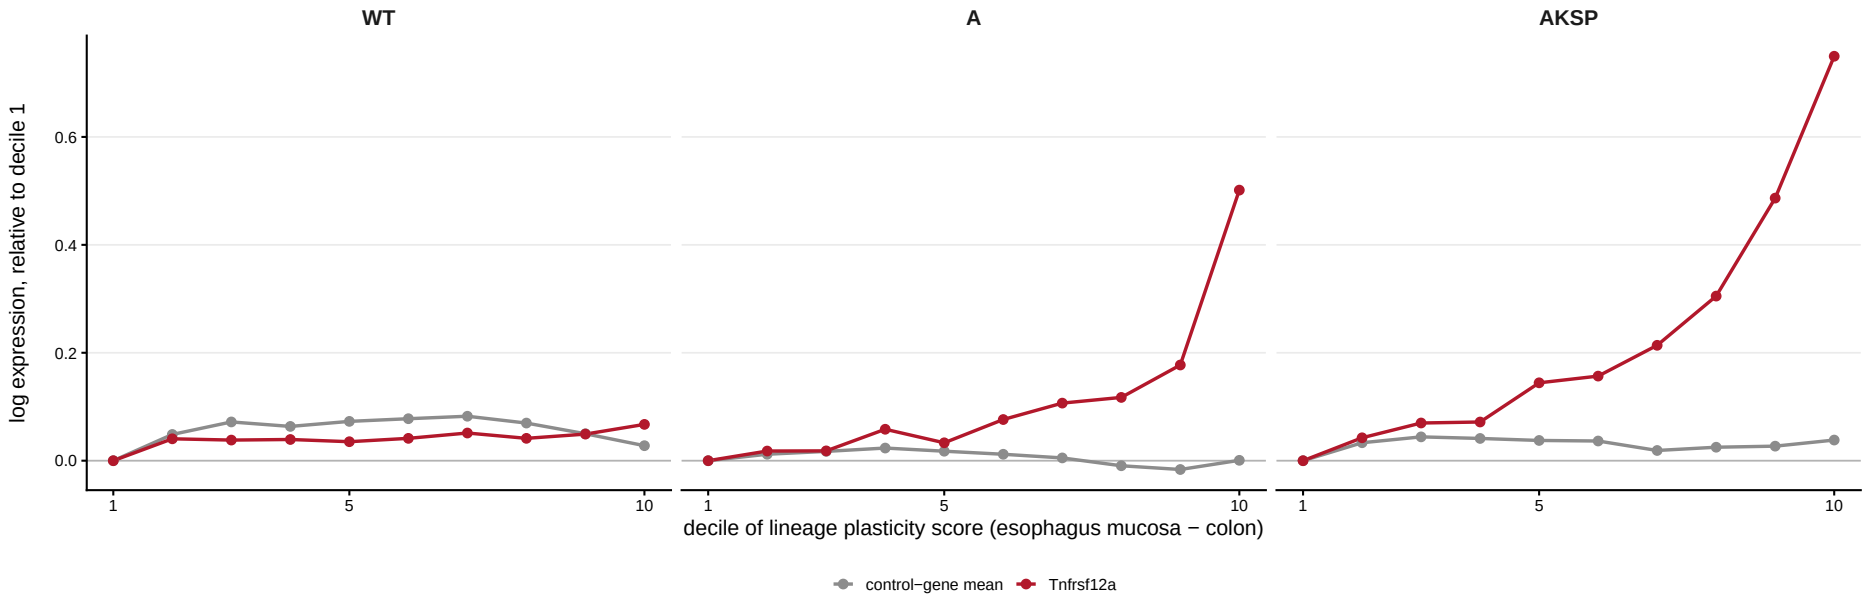
d

Correlation with lineage plasticity

cells are not independent; the claim is the gap from the control genes, at identical n



c

Along the lineage plasticity axis the paper uses in Fig. 1j–l


the axis is flat in WT and rises in both tumour models
